

Vortex flow sensors // VVX

US version available

Note: The US versions are separate products.
The units are not converted, but pre-configured at the factory for the respective variants.

VVX32 brass

VVX40 stainless steel

100 %

- Final water flow test
- Adjustment of output signal and calibration at 3 test points
→ Traceable measurement performance
- Recording of the test data
→ Test protocols available for customers
- Traceability via serial number

Combination sensor

- Combination of flow and temperature measurement
- Flow measurement with no moving parts
- Fast responding temperature measurement

µController

- Customisation through approx. 60 software parameters
- Software filter (optional)
→ exact flow measurement even with vibrations

On the test bench: 100% Final water flow test

encapsulated piezoceramic sensor element

Reliable

- Piezoceramic sensor element completely encapsulated
→ no direct medium contact
→ dirt-resistant and fail-safe
- Robust metal body
- CE Marking
- OEM product developed and produced in Germany

Test reports for customers

- SIKA test labs - many qualification tests
→ Temperature shock
→ Contamination
→ and many other tests
- Sample devices can be supplied with works test certificate

Reliable partnership with SIKA

- More than 45 years of experience with flow sensors in heaters
- Leading heat pump manufacturers trust in SIKA Vortex flow sensors

General information on the principle of operation

Alternate vortices rotating in opposite directions are generated behind a bluff body immersed in a flow. The vortices detach from the edges of the bluff body and form a Kármán vortex street in the fluid stream. The distance between the single vortices is constant. The frequency of the vortices flowing past a sensor depends on the flow rate and is proportional to the flow. The sensor detects these vortices which are then converted to an electrical frequency signal.

- Minimal flow obstruction → low pressure drop
- Independent of the conductivity of the medium
- High long-term stability / no zero drift

Wiring

Pin assignment

The pin assignment depends on the chosen configuration of the device.

Possible pin assignments:

Pin 1: $+U_B$

Pin 2: $U_{Flow} \cdot R_{Temp}$ • Analog U/I

Pin 3: **GND**

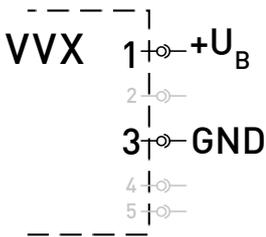

Pin 4: Frequency • Analog U/I • Alarm*¹

Pin 5: $U_{Temp} \cdot R_{Temp}$

*¹ The alarm output is only possible with the corresponding firmware and has been determined during the order.

Wire the connecting cable according to your device version and the pin assignments shown on the type plate.

Flow

Push-Pull*¹

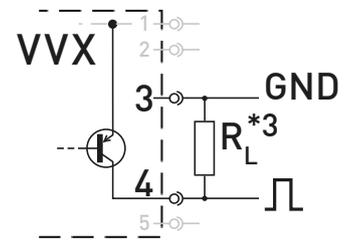

NPN Open Collector

$R1 \leq 47 \Omega / R2 \geq 10 \text{ k}\Omega$

PNP Open Collector

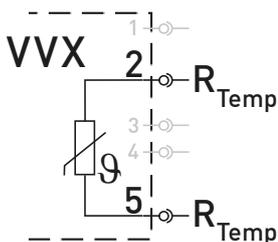

*¹: Not at 5 V.

*²: Do not wire the push-pull switch outputs of multiple VVX devices in parallel.

*³: Recommended pull-up / pull-down resistance $R_L \sim 5 \text{ k}\Omega$.

VVX with temperature (optional)

Use of frequency output and optional functions

The frequency output can be wired together with the optional functions. However, not every combination is possible. In principle, the pins 2, 4 and 5 can only be assigned with one function at a time. A multiple assignment is not possible. The wiring results from an overlay of the circuit diagrams of the corresponding functions, as shown in the two following examples.

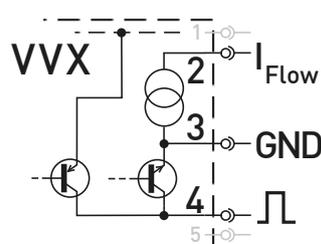

Flow NPN + Analogue 0.5...3.5V

$R1 \leq 47 \Omega / R2 \geq 10 \text{ k}\Omega$

Recommendation for resistance $R_L \sim 5 \text{ k}\Omega$

Flow Push-Pull + current 4...20 mA
